(54) Title: **ENDOSCOPIC RETRACTOR**

(57) Abstract: The present disclosure relates to endoscopic retractors including a shaft having at least a first section having a first mechanical interface and a second section having a second mechanical interface for engaging the first mechanical interface, the first section and the second section being selectively movable from a first, generally longitudinally-aligned configuration along an axis defined through the shaft and the first mechanical interface is disengaged from the second mechanical interface, to a second configuration wherein the second section is disposed at an angle relative to a longitudinal axis of the shaft and the first mechanical interface is engaged with the second mechanical interface. The retractor further includes at least one cable extending through the shaft and is operatively secured to the second section. The cable is remotely actuatable to move the second section from the first to the second configuration upon selective translation of the cable.
